Clothes Factory Management System

Bug Report

Software Testing and Automation Assignment

1.UI BUG REPORT

Clothes Factory Management System

1.1. Introduction

This report documents the UI bugs identified during testing of the Clothes Factory Management System.

The application was tested using Microsoft Edge and browser Developer Tools. Responsive testing was performed using different screen widths.

Two genuine UI issues were identified and documented based on the observed application behavior and supporting screenshots.

1.2. Bug Report – UI-001

Bug ID: UI-001

Bug Title: Mobile Responsive Layout Failure

Module: Overall Application (Workers, Orders, Production)

Bug Description:

The application does not properly adjust its layout to smaller mobile screen sizes. Some content elements extend beyond the visible screen area, causing headings and form elements to become partially hidden or cut off.

Steps to Reproduce:

1. Open the Clothes Factory Management System.
2. Open Microsoft Edge Developer Tools.
3. Enable Responsive Device Mode.
4. Set the screen width to 320px.
5. Navigate to the Production or other application pages.
6. Observe the layout and visible content.

Expected Result:

The application should automatically adjust its layout according to the screen size. All headings, input fields, buttons, and other content should be displayed properly without unwanted horizontal overflow.

Actual Result:

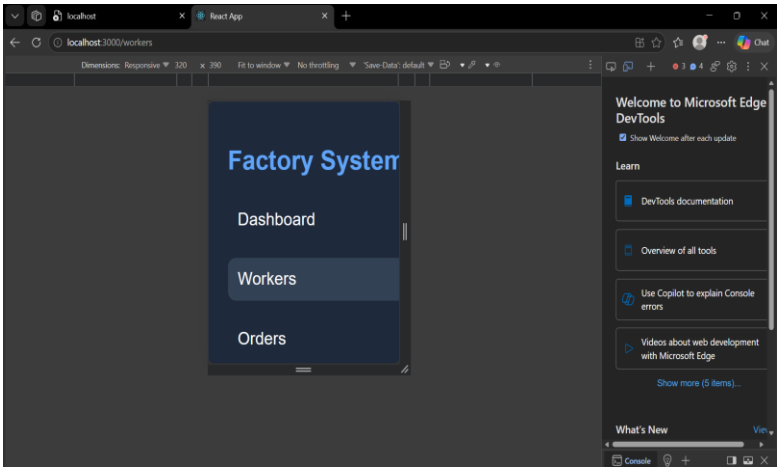

Some content elements are cut off or partially hidden when the application is viewed on smaller mobile screens.

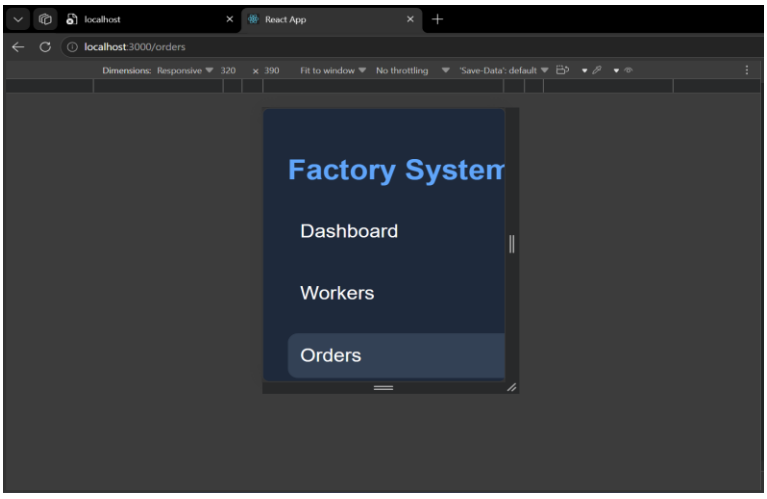

Severity: High

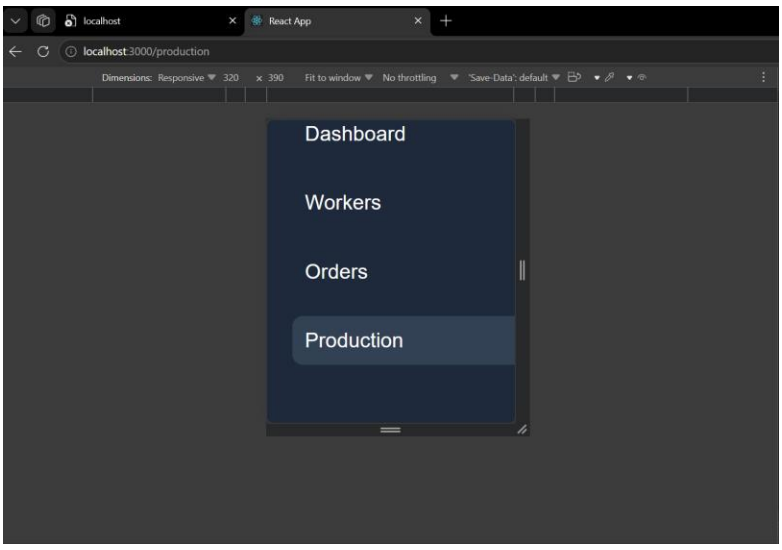

Priority: High

Supporting Evidence:

Screenshots captured during responsive testing at 320px and 390px screen widths.

1.3. Bug Report – UI-002

Bug ID: UI-002

Bug Title: Factory Image Not Loading

Module: Dashboard

Bug Description:

The factory image used in the application does not load correctly. The browser reports a failed resource request for the image file named factory.jpg.

Steps to Reproduce:

1. Start the backend and frontend applications.
2. Open the application using http://localhost:3000.
3. Navigate to the Dashboard.
4. Observe the factory image.
5. Open Browser Developer Tools and check the Console.

Expected Result:

The factory image should load successfully and be displayed in the Dashboard.

Actual Result:

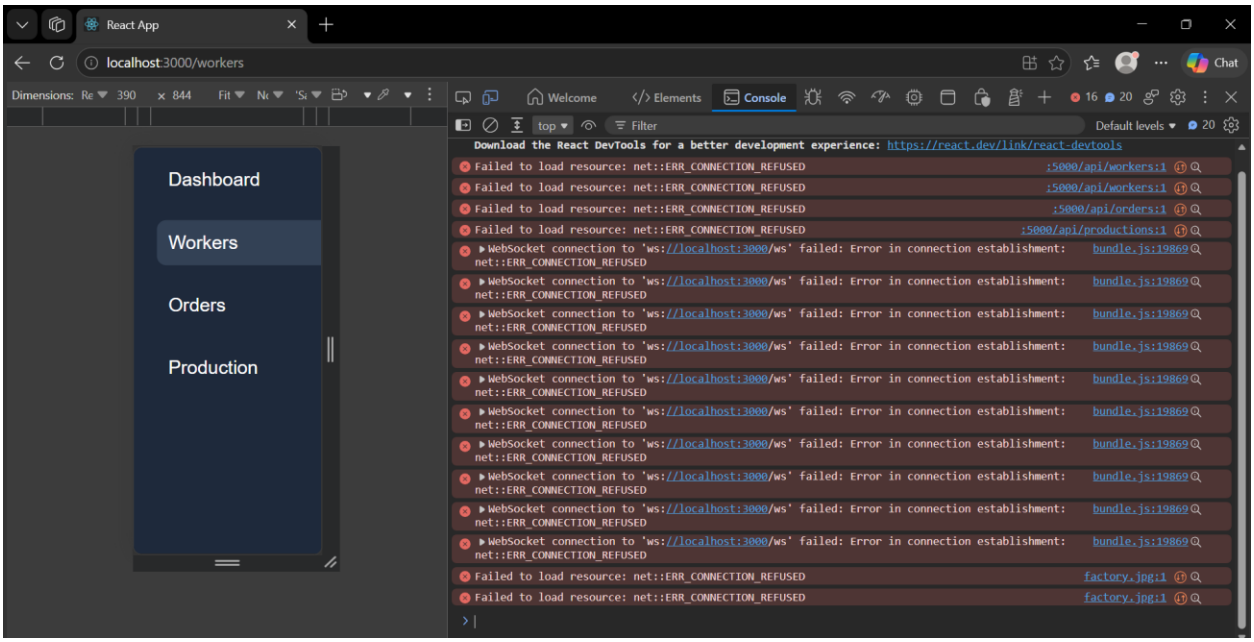

The factory image fails to load. The browser console displays a failed resource loading error for factory.jpg.

Severity: Medium

Priority: Medium

Supporting Evidence:

Screenshot of the browser Developer Tools Console showing the failed resource request for factory.jpg with net::ERR_CONNECTION_REFUSED.

1.4. Summary of Identified UI Bugs

Bug ID	Bug Title	Severity	Priority
UI-001	Mobile Responsive Layout Failure	High	High
UI-002	Factory Image Not Loading	Medium	Medium

2.API BUG REPORT

1. **Bug ID**: API-BUG-01
2. **Bug Title**: System Allows Order Creation with Negative Quantity
3. **Module**: Order Management
4. **Bug Type**: API Validation Bug
5. **API Method**: POST
6. **Endpoint**: http://localhost:5000/api/orders
7. **Severity**: Medium
8. **Priority**: Medium
9. **Status**: Open

Preconditions

- Backend server is running.

- MongoDB is connected.

- Postman is available.

Steps to Reproduce

1. Open Postman.

2. Select **POST** method.

3. Enter the endpoint: **http://localhost:5000/api/orders**

4. Select **Body → raw → JSON**.

5. Enter the following request body:

{ "customerName": "Shruthi",

"product": "shorts",

"quantity": -5 }

6. Click Send.

7. Observe the response.

8. Send a GET request to “/api/orders”.

9. Verify whether the negative quantity order is saved.

Expected Result

The system should reject negative quantity values and return an appropriate validation error, such as HTTP 400 Bad Request.

Actual Result

The API returned HTTP 201 Created and successfully stored an order with quantity -5 in the database.

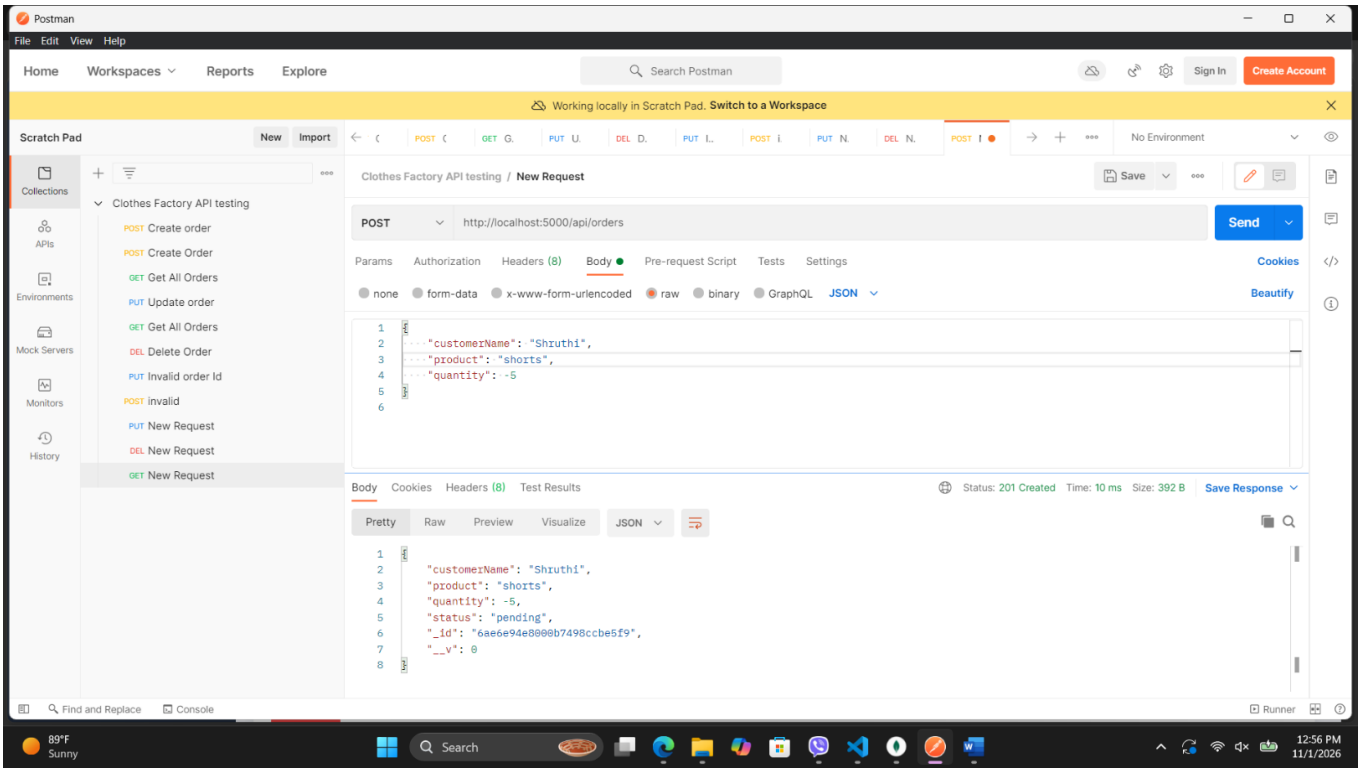

Evidence

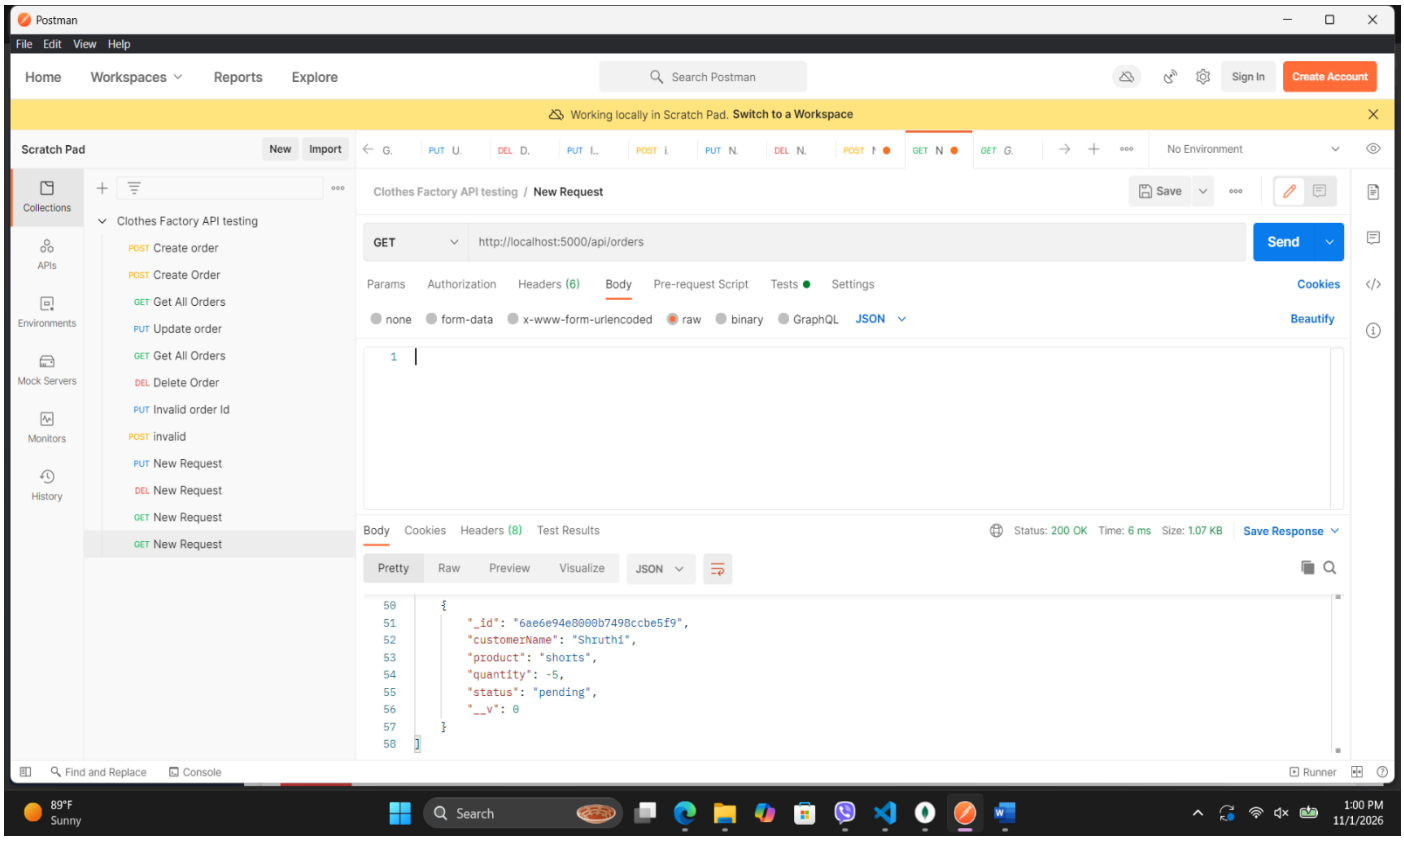

- Screenshot 1: POST request showing quantity -5 and HTTP 201 Created.
- Screenshot 2: GET request showing the saved order with quantity -5 and HTTP 200 OK.

Remarks

The API does not properly validate negative quantity values before creating an order.

API Testing Summary

Test Case	Status
1. Empty required fields	PASS
2. Create valid order	PASS
3. Update order	PASS
4. Delete order	PASS
5. Invalid Order ID	PASS
6. Negative quantity	FAIL – BUG found

3. Overall Testing Conclusion

During testing of the Clothes Factory Management System, two UI issues and one API validation bug were documented based on the observed test results. The UI testing identified a responsive layout problem on narrow mobile screens and a failed factory.jpg resource request in the captured browser session. API testing identified that the system accepts and stores an order with a negative quantity instead of rejecting the request with a validation error.

The API test summary shows that empty required fields, valid order creation, order updating, order deletion and invalid order ID handling passed. The negative quantity test failed and revealed the API bug. The identified issues should be reviewed and corrected to improve the application's usability, reliability and data validation.

All findings in this report are based on the tests and screenshots recorded during the testing process. The screenshots should be attached as supporting evidence under their corresponding bug reports. No additional bugs have been assumed or fabricated.

4. Evidence Checklist

- UI-001: Mobile responsive screenshots at 320px and 390px.
- UI-002: Developer Tools Console screenshot showing the failed factory.jpg request.
- API-BUG-01: Postman POST screenshot showing quantity -5 and HTTP 201 Created.
- API-BUG-01: Postman GET screenshot showing the saved order with quantity -5 and HTTP 200 OK.
